

The Season 2 Landing Cheat Sheet

Polar Storm · Frozen Map · Rare Soil War

Written by an active R5. Distribute freely inside your alliance.

The 4 coordinates every alliance botches

Alliance Furnace tile

The single tile your R4/R5 plants the Alliance Furnace on. Must be a Level-1 territory. Must be inside your intended corner but far enough in that the hive can wrap it. Once placed, up to 20 members must reinforce it to activate — no build-time delay after activation.

Assembly Point

Should sit near the Alliance Furnace but OUTSIDE the 25×25 Warlord Missile blast area. The Assembly Point is your evicted-defenders' return tile when a Warlord Missile lands (every base inside the blast area is randomly teleported across the map on impact).

Rally leaders' anchor tiles

R4/R5 rally leaders — Marshal, Warlord — pin to the inner ring adjacent to the Alliance Furnace. Their rally leader temperature bonus applies to the entire rally, so lower-power members can join operations deep in the frost.

Weakest-member fallback ring

Weakest members (lowest HQ, lowest heat stack) park CLOSEST to the Alliance Furnace. Stronger anchors absorb hits on the outer ring. This inverts the intuition — most alliances put their strongest on the furnace because that's where the fighting is. Wrong. Freeze cascades kill weak members first; put them in the warmest ground.

• Furnace • Rally leader • Weakest • Assembly

HQ-level to landing tier priority

Weaker players get the warmest tiles. Strongest anchor the outer ring. Alliance Furnace at L1 puts out only +3 °C, so tile choice matters more than gear at the start of Week 1.

HQ Level	Landing Tier	Distance from Furnace	Reason
HQ 30+	OUTER RING	8–12 tiles	Absorbs hits · rally anchor · high heat stack
HQ 27–29	MID RING	5–7 tiles	Backup reinforcement · shares heat radius
HQ 24–26	INNER RING	3–4 tiles	Needs city + furnace coverage to survive W3 blizzard
HQ ≤ 23	FURNACE ADJACENT	1–2 tiles	Any freeze cascade kills them first · park here

Notes:

- ❑ L6 city grants +60 °C in range — captured cities snap the local tile to -10 °C, effectively a warm island.
- ❑ Do NOT park directly on the Alliance Furnace tile — the 25×25 Warlord Missile blast will teleport you away.
- ❑ The 5-tile safe-distance rule (outside the 25×25 blast) still applies to everyone, weak or strong.

Rally leader placement — the 3-second window

Rallies use the leader's temperature bonus — every member in a rally inherits the leader's heat stack. This is why a low-heat R2 can join a rally into the -80 °C Capitol zone if the R5 leading has +131 °C stacked. Place your rally leaders where they can start rallies inside 3 seconds of a call in alliance chat.

Key facts:

Rally leaders (Marshal, Warlord) MUST be within 1–2 tiles of the Alliance Furnace.

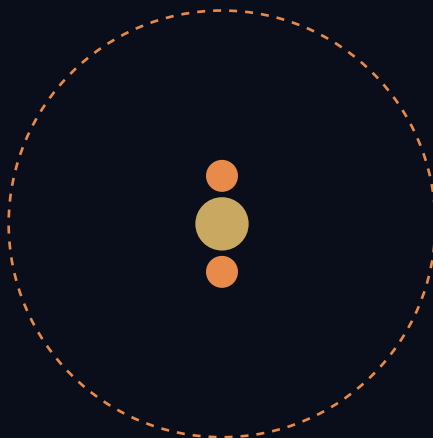

The Warlord Missile has a 3-minute (180s) prep window during which the enemy Warlord's base coordinates are broadcast in world chat — cancel it by rallying their base and forcing a breach or relocation.

A cancelled Warlord Missile applies a 72-hour cooldown on the missile skill (not the Warlord role — rotate title to a shadow Warlord R4 to keep another missile ready).

Combat opens at 12:30 server time on Wednesday and Saturday of every war week — Prep runs 12:00–12:30, Combat runs 12:30–13:10 (40 min max).

Season 2 has NO Alliance Safe Time (that's Season 5+). Every alliance on your warzone fights on the same fixed 12:30 server-time schedule.

Below: standard rally-leader anchor pattern. Furnace at center; two rally leaders at N/S with 1-tile buffer; Assembly Point outside the 25×25 blast ring so evicted bases have somewhere to return.

Furnace · Rally leaders adjacent · Assembly outside 25×25 blast

First 72 hours: build order & resource ratio

Coal is fuel and factory-upgrade currency. Titanium is furnace-upgrade currency only. Rare Soil is season rank + Alliance Furnace auto-upgrade trigger. Meat and iron are base-game resources — Season 2 does not consume them at unusual rates, so keep normal RSS gathering going but prioritize coal above all else.

Priority order:

1. HOUR 0–2: R4/R5 deploys Alliance Furnace on a Level-1 territory. Every online member reinforces immediately (~20 needed to activate).
2. HOUR 0–2: Every member builds their own High-Heat Furnace (personal, max L30) and turns on the 'auto-activate in blizzard' toggle.
3. HOUR 2–12: Capture your first Level-1 dig site (adjacency rule — first alliance capture MUST be an L1 dig site).
4. HOUR 2–24: Every member builds Titanium Alloy Factory #1. Factory #2 unlocks at L15 on #1; same for #3 and #4.
5. HOUR 12–72: Radar missions cleared for coal payout (stack radars before season start; first-kill on a level-180 Wanderer post-transition = ~200,000 coal community-reported).
6. HOUR 24–72: R5 captures 2nd dig site (2 captures/day cap) and starts positioning for first L1 city (unlocks W1 day 3 + 12h).

Resource	Where it goes	Prioritize
Coal	Furnace fuel + Titanium factory upgrades	☐☐☐ HIGHEST — everything downstream needs it
Titanium	High-Heat Furnace upgrades ONLY	☐☐ Only after factories are producing at L15+
Rare Soil	Season rank + Alliance Furnace auto-upgrade	☐☐☐ Capture territory early; hold forever
Meat / Iron	Base-game troop training + healing	☐ Keep normal gathering; not the bottleneck
Oil	Vehicle production (base-game)	☐ Keep normal gathering; not the bottleneck

Notes:

- Alliance Furnace L20 burns 1,440 coal/min normal, 5,760 coal/min overdrive — plan 50 coal donations/member/day cap.
- ☐ Do NOT kill your highest-level Wanderer / Doom Walker BEFORE the map transition — the coal first-kill reward only pays out post-transition.
- ☐ Titanium Alloy Factory upgrade coal cost: L1 = 720 · L15 = 137,000 · L30 = 359,300. Full 4-factory build to L15 is ~Week 1-2 priority.

You're screwed if... (the R5 warning checklist)

1. Your Alliance Furnace isn't activated by end of Day 1.

20 reinforcements gate it. If nobody garrisons, nobody has shared heat. Week 1 -30 °C blizzard freezes half the hive.

2. Your first alliance capture isn't a Level-1 dig site.

The adjacency rule locks you out of expansion. Every subsequent capture must be adjacent to existing alliance territory — the L1 dig site is your anchor.

3. You parked bases directly on the Alliance Furnace tile.

Warlord Missile lands, 25×25 blast area, every base inside gets randomly teleported across the map. You'll spend 30+ minutes teleporting back while defenders are down.

4. Your Warlord officer burned the missile skill before a war round.

72-hour cooldown. Rotate the Warlord title to a shadow R4 who hasn't fired theirs — otherwise you enter Wednesday war with no missile available.

5. You captured into a higher stockpile bracket you can't defend.

Rare Soil War brackets (Ranks 1–10, 11–20, 21–30, 31–50) are set by stockpile. Over-capturing promotes you into a tougher bracket where you get plundered faster than you produce.

6. Your weakest HQs are on the outer ring.

Freeze cascades kill low-heat members first. Weak = furnace-adjacent. Strong = outer ring. Getting this backwards is the #1 wipe pattern.

7. Nobody enabled 'auto-activate in blizzard' on their High-Heat Furnace.

Blizzards are announced hours in advance but if a member is asleep, the auto-toggle is what keeps them from freezing. Enable it Day 1, no exceptions.

8. You planned around 'Alliance Safe Time' from a Season 5 guide.

Season 2 has no Safe Time. Every alliance fights at 12:30 server time on Wednesday and Saturday. If your server-time = 04:30 local, that's the hour you fight. Plan the roster around it.

Get the Landing Planner tool

This cheat sheet gets you 80% of the way. The Landing Planner tool does the last 20% — assigns every one of your 100 members a specific tile relative to your anchor, exports a labeled PNG for Discord, and generates a Freeze-Risk score per member before Day 1 even starts.
